(54) Title: PLUG MADE OF MESH MATERIAL FOR CLOSING LARGE TROCAR WOUNDS

(57) Abstract: The invention is about a material and its relevant technique that is used in the repair of large trocar wounds. The method as a whole is simple to use and minimizes tissue trauma. With this invention, the rest of the suturing techniques are set aside, and by the use of a specially designed plug, the trocar wound repairing process is reduced to a simple and quick procedure. The material is basically made of polypropylene, of which a specific layer covers the intraabdominal face. The material functionally consists of three pieces, and can be called as plug and mesh. The plug and mesh can be used in the repair of almost all large trocar fascial defects that occur at laparoscopic surgery. Due to its unique design, the plug and mesh can fix most of these large trocar wounds safely and securely.
